

Ivanti® Asset Intelligence

Ivanti® Asset Intelligence helps you optimize IT assets from the moment of purchase. Discover and inventory owned hardware and software assets, aggregate vendor data with B2B connectors, and monitor software license usage for intelligent business decision-making. The solution provides a broad view of how users interact with assigned software applications to ensure license compliance. You establish appropriate spending patterns on needed assets and curb overspending by identifying and reclaiming unused licenses.

Optimize Your IT Investments through Reclamation

Achieve visibility through software monitoring and comprehend clearly what's in use, when it was last used, and for how long it was deployed to determine appropriate reclamation processes and policies. You maximize your organization's software licenses and enable users to make license requests for authorized software. No over-spending required.

Gain Control Over Software Compliance

Software audits are increasingly more common. Software not purchased, maintained, or licensed correctly places organizations at risk of license non-compliance. The incurred penalties and unexpected true-up costs can drain financial resources. Ivanti Asset Intelligence delivers detailed insight into your current software license usage so you can negotiate more favorable licensing deals, eliminate over-buying of licenses, minimize rogue purchases, and avoid fines associated with failed audits.

Close the Vendor Visibility Gap with B2B Connectors

Eliminate spreadsheets and gain vendor visibility with business-to-business connectors that aggregate manufacturer, vendor, and reseller data such as purchase order numbers, device types, and location mapping from the moment you acquire a new asset. Collect this information automatically from vendor and reseller connectors like Apple, Dell, HP, IBM, Lenovo, Lexmark, Verizon, CDW, and En Pointe, and more from a continually growing number of connectors.

Discover Your IT Environment

The first step in managing your IT assets is to know what assets you have. The discovery and tracking processes in Ivanti Asset Intelligence identify and aggregate data automatically on existing software and hardware in your infrastructure, including printers and SNMP devices. Determine assets in use and understand where you can optimize your investments. Accurate information about your owned assets delivered at the right time drives confidence in data and fosters informed decision-making.

Standardize Asset Naming with Data Normalization

Ivanti Asset Intelligence employs a normalization and rules engine that applies standard naming conventions automatically to collected asset data and reporting fields. This eliminates reporting and management headaches associated with varied and complex vendor naming schemes.
